Integrin $\alpha 2\beta 1$-Dependent Contraction of Floating Collagen Gels and Induction of Collagenase Are Inhibited by Tyrosine Kinase Inhibitors

Arsi Broberg and Jyrki Heino [1]

MediCity Research Laboratory and Department of Medical Biochemistry, University of Turku, Tykistökatu 6A, FIN-20520, Turku, Finland

Received 29 January 1996; revised 13 June 1996. Available online 19 April 2002.

Abstract

A cell culture inside a three-dimensional gel of fibrillar collagen is an experimental model used to study the response of cells to the extracellular matrix. Many cell types induce the contraction of gel and simultaneously decrease their production of type I collagen, whereas the expression of interstitial collagenase (matrix metalloproteinase-1; MMP-1) is enhanced. We have previously shown that in osteogenic cells the collagen receptor $\alpha 2\beta 1$ integrin is a positive regulator of MMP-1 and that the number of $\alpha 2\beta 1$ integrins on the cell surface also regulates the magnitude of contraction. However, the downregulation of collagen mRNA levels is not initiated by $\alpha 2\beta 1$ integrin. Here, we have studied in human KHOS-240 and MG-63 osteosarcoma cells and in human skin fibroblasts the effects of tyrosine kinase inhibitors on collagen gel contraction and on the regulation of MMP-1 and collagen $\alpha 1$(I) genes by extracellular collagen. The induction of MMP-1 could be inhibited by all tyrosine kinase inhibitors tested with the exception of genistein. None of them could prevent the downregulation of collagen expression. Thus, the collagen-induced alterations in the expression of MMP-1 and collagen $\alpha 1$(I) seem to be dependent on distinct signal transduction pathways. Many of the inhibitors, including genistein, could prevent the contraction of collagen gels. The effect was not related to their ability to inhibit cell growth, because an inhibitor specific for DNA synthesis and cell division did not have the same

effect. Thus, we suggest that the process of collagen gel contraction requires protein-tyrosine phosphorylation and that the ability of cells to contract collagen gels is not related to the induction of MMP-1 or to the level of collagen α1(I) expression. Finally, we propose that the tyrosine kinase inhibitors might be considered as candidate molecules in the treatment of pathological scar contraction.

Meaning of SCAR

Pronunciation: skÃ¢r

WordNet Dictionary

Definition:

1. [n] an indication of damage
2. [n] a mark left (usually on the skin) by the healing of injured tissue
3. [v] mark with a scar; "The skin disease scarred his face permanently"

Websites:

Synonyms: cicatrice, cicatrix, mark, mark, pit, pock, scrape, scratch

See Also: blemish, blemish, callus, cheloid, cicatrise, cicatrize, deface, defect, disfigure, incise, keloid, pockmark, sw symptom, vaccination

Products Dictionary

Definition: **Scar**

more details ...

Webster's 1913 Dictionary

Definition:

1. \Scar\, n. [OF. escare, F. eschare an eschar, a dry slough (cf. It. & Sp. escara), L. eschara, fr. Gr. ? hearth, fireplace, scab, eschar. Cf. {Eschar}.]
   1. A mark in the skin or flesh of an animal, made by a wound or ulcer, and remaining after the wound or ulcer is healed; a cicatrix; a mark left by a previous injury; a blemish; a disfigurement.

      This earth had the beauty of youth, . . . and not a wrinkle, scar, or fracture on all its body. --T. Burnet.

   2. (Bot.) A mark left upon a stem or branch by the fall of a leaf, leaflet, or frond, or upon a seed by the separation of its support. See Illust.. under {Axillary}.

2. \Scar\, v. t. [imp. & p. p. {Scarred}; p. pr. & vb. n. {Scarring}.]
   To mark with a scar or scars.

   Yet I'll not shed her blood; Nor scar that whiter skin of hers than snow. --Shak.

   His cheeks were deeply scarred. --Macaulay.

3. \Scar\, v. i.
   To form a scar.

4. \Scar\, n. [Scot. scar, scaur, Icel. sker a skerry, an isolated rock in the sea; akin to Dan. ski[ae]r, Sw. sk["a]r. Cf. {Skerry}.]
   An isolated or protruding rock; a steep, rocky eminence; a bare place on the side of a mountain or steep bank of earth. [Written also {scaur}.]

   O sweet and far, from cliff and scar, The horns of Elfland faintly blowing. --Tennyson.

5. \Scar\, n. [L. scarus, a kind of fish, Gr. ska`ros.] (Zo["o]l.)
   A marine food fish, the scarus, or parrot fish.

Dream Dictionary

Definition: Seeing a scar in your dream, symbolizes struggles and/or painful memories and bad feelings which may h entirely healed and still continue to linger in your mind. It suggests that your past still has some influence your life. Alternatively, a scar may represent deep-seeded insecurities which may be holding you back fror your goals.

Biology Dictionary

Definition: A scar is an abnormal condition of the skin after injury. It is characterized by dense fibrotic tissue covered epidermis.

AB . . . is mitogenic for fibroblasts and a stimulatory factor for collagen synthesis. Objectives: We have assessed the in vitro effects of **quercetin** on proliferation, collagen synthesis and the expression of the IGF system in keloid-derived fibroblasts. Methods Fibroblasts were isolated from earlobe keloids and exposed to **quercetin** at different concentrations. The inhibitory effects of **quercetin** on fibroblast proliferation were assayed using 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide (MTT) assay, Western and Northern blot analyses. Results: **Quercetin** inhibited keloid fibroblast (KF) proliferation in a dose-dependent manner. Significant growth inhibition was observed on day 2 of culture. The. . . growth inhibition was approximately 25 μg mL(-1). Collagen 1 expression was significantly decreased while collagen 3 was almost undetectable following **quercetin** treatment. Basal levels of IGF-I receptor (IGF-IR) β subunits, p85 subunit of phosphatidylinositol 3-kinase, c-Raf, phospho-Raf-1, phosphoMEK 1/2, phospho-mitogen-activated protein kinase, phospho-Elk-1 and phospho-Akt-1 were significantly reduced when KF cells were exposed to **quercetin** for 24 h. Blocking IGF-IR activity with IGF-IR antibody or neutralizing endogenous IGF-I activity with IGF-I antibody led to significant. . . Conclusions: Because the IGF system plays an important part in fibroblast cell proliferation and collagen production, the described activities of **quercetin** on the IGF system and collagen expression may provide a novel approach for the use of **quercetin** in treatment and/or prevention of hypertrophic **scar** and keloid.

AB Currently accepted conservative treatments of hypertrophic **scars** are limited to steroid injections, radiation therapy, and silicone occlusive therapy. However, the use of Mederma for these problematic lesions. . . quite prevalent in the clinical setting. Little scientific evidence exists to support the efficacy of this product in reducing hypertrophic **scars**. The aim of this study was to study the effects of Mederma on hypertrophic **scars** in the rabbit hypertrophic **scar** model, allowing the histologic quantification of **scar** elevation, dermal collagen organization, vascularity, and inflammation and the gross examination of **scar** erythema. Full-thickness wounds down to cartilage, four per ear, were created in four New Zealand White rabbits, for a total of 32 **scars**. Twenty-eight days after the initial wounding, the hypertrophic **scars** were photographed, and treatment of half of the

scars on each ear was begun with Mederma three times per day for a total of 4 weeks. The untreated **scars** served as control **scars** and were left exposed to air. After 4 weeks of treatment, the **scars** were once again photographed. The rabbits were then killed, and the **scars** were analyzed histologically. The pretreatment and posttreatment photographs were compared by using computer quantification of magenta, yellow, and cyan expression within the **scars**. Histologic analysis demonstrated no significant reduction in **scar** hypertrophy or **scar** elevation index. However, a significant improvement in dermal collagen organization was noted on comparing Mederma-treated **scars** with untreated control **scars** ($p < 0.05$). No significant difference in dermal vascularity or inflammation was noted. Computer analysis of the **scar** photographs demonstrated no significant reduction in **scar** erythema with Mederma treatment. The active product in Mederma, allium cepa, has as its derivative **quercetin**, a bioflavonoid noted for its antiproliferative effects on both normal and malignant cells, and its antihistamine release effects. These properties could theoretically prove beneficial in reversing the inflammatory and proliferative responses noted in hypertrophic **scars**. Despite the authors' inability to demonstrate a reduction in **scar** hypertrophy, the improvement in collagen organization noted in the Mederma-treated **scars** suggests it may have an effect on the pathophysiology of hypertrophic **scar** formation.

AB Patients with proteinuria tend to develop progressive renal disease with proximal tubular cell atrophy and interstitial **scarring**. It has been suggested that the nephrotoxicity of albuminuric states may be due to the protein mol. itself or by lipids, such as lysophosphatidic acid (LPA), that albumin carries. LPA was found to cause a transient increase in intracytoplasmic free Ca2+ ([Ca2+]i) in opossum kidney proximal tubule cells (OK) that was maximal at 100 μM LPA and was dose dependent with an EC50 of 2.6+10-6 M. This Ca2+ mobilization was from both internal stores and across the plasma membrane and was pertussis toxin (PTX) insensitive. Treatment of OK cells with 100 μM LPA for 5 min was found to cause a twofold increase in [3H]thymidine incorporation and a three- to fivefold increase over control after 24 h. This was highly PTX sensitive and insensitive to pretreatment with the tyrosine kinase inhibitors **genistein** and herbimycin A. These findings may be of significance in the progression of renal disease and indicate the potential importance of lipids in modulating proximal tubule cell function and growth.

L36 ANSWER 70 OF 149 USPATFULL on STN

SUMM In some of its method aspects, the present invention provides methods for **treating** cardiovascular disease, **treating** inflammatory disease, accelerating wound healing, **decreasing scarring** during wound healing, and **preventing** tumor angiogenesis and/or metastasis comprising administering to a subject in need of such **treatment** an effective amount of at least one peptide or compound based on a thrombin receptor sequence.

DRWD FIG. 6 illustrates the effects of **genistein** and indomethacin on the actions of P5-NH.sub.2 and carbachol in the RLM assay.

DETD . . . the healing process. The acceleration of would healing would also prove of value in the use of skin grafts for **treating** burn patients and in **treatment** of ocular injuries. It is likely that thrombin itself, generated at the site of injury, plays an important role in. . . healing process; alternatively, in some situations, one might wish to delay the healing process to avoid the formation of inappropriate **scarring**, leading to the formation of cheloid. Thus, for sites of injury and tissue repair, it could prove of use to. . . antagonists, depending on the situation. A non-degradable super-active analogue of the thrombin receptor peptide may be preferably used for such **treatment** in both humans and animals. The agents may also be used in the therapy of duodenal, ileal and colonic ulcer. . .

DETD . . . action of P5 in the GLM preparation was also selectively blocked by relatively low concentrations of the tyrosine kinase inhibitors, **genistein** (GS) and tyrphostin (TP)(14). We wished to determine if the active P5 analogues modified at the C-and N-terminus (represented by. . . E, F, G and H), the contractile actions of both P5--NH.sub.2 and Pr-P4 were blocked by either indomethacin or tyrphostin; **genistein** was similarly effective (not shown). Because of the desensitization caused by Pr-P4, in the experiments shown for the GLM in. . . tissue sensitivity to TRPs was evaluated by exposure to P5--NH.sub.2 (5 μg/mL; 7.8 μM) before determining the effects of tyrphostin, **genistein** and indomethacin on Pr-P4 action (G, H, FIG. 5). In contrast, the responses of the RA, which were abolished with. . . in FIG. 6, the response of the RLM preparation to P5-NH.sub.2 was also quite sensitive to tyrphostin (not shown) and **genistein** (77±3% inhibition: mean ±S.E.M for n=6) but was only partially affected by indomethacin (40±6% inhibition: mean ±S.E.M. for n=6). In. . .

DETD . . . indomethacin, noradrenaline and angiotensin-II and thrombin (human, 3000 to 4000 U/mg; 1 U/mL.perspectiveto.10 nM) were from Sigma (St. Louis, Mo.); **genistein** (GS) was from ICN Biochemicals, Costa Mesa, Calif. Tyrphostin (TP) (RG 50864, also designated AG213) was obtained through the courtesy of Dr. R. R. Swillo, Rhone-Poulenc Rorer (Collegeville, Pa). **Genistein** and tyrphostin were dissolved in dimethylsulfoxide (DMSO) to yield a stock solution that, when diluted, resulted in a concentration of. . .

PI US 5516889 19960514

ANSWER 51 OF 60 PCTFULL COPYRIGHT 2004 Univentio on STN

DETD Anti-acne actives can be effective in **treating** acne vulgaris, a chronic disorder of the pilosebaceous follicles. The condition involves inflammation of the pilosebaceous apparatus thereby resulting in lesions, which may include papules, pustules, cysts, comedomes, and severe **scarring**. The bacteria,Corynebacterium acnes and Staphylococcus epidermidis are usually present in the pustular contents.

. . .

from Laboratories Serobiologiques); formononetin; forsythia fruit extract; gallic acid esters; gamma butyric acid; GATULINE RC (available from Gattlefosse, located in Priest, France); **genistein**; genisteine; genistic acid; gingko bilboa extracts; ginseng extracts; ginsenoside (RO, R6-,, R6-2,R6-3, Rc, RD, RE] RP RF]29 P]6-1] RG-2); gluco pyranosyl-l-ascorbate; glutathione. . .

L36 ANSWER 55 OF 149 USPATFULL on STN

DETD . . . decrease the severity of symptoms; decrease the duration of disease exacerbations; increase the frequency and duration of disease remission/symptom-free periods; **prevent** fixed impairment and disability; and/or **prevent**/attenuate chronic progression of the disease. Clinically, this would result in improvement in visual symptoms (visual loss, diplopia), gait disorders (weakness,. . . dysfunction (weakness, spasticity, sensory loss), bladder dysfunction (urgency, incontinence, hesitancy, incomplete emptying), depression, emotional lability, and cognitive impairment. Pathologically the **treatment reduces** one or more of the following, such as myelin loss, breakdown of the blood-brain barrier, perivascular infiltration of mononuclear cells, immunologic abnormalities, gliotic **scar** formation and astrocyte proliferation, metalloproteinase production, and impaired conduction velocity.

DETD . . . Utilizing the agents, compositions and methods provided herein a wide variety of surgical adhesions and complications of surgery can be **treated** or **prevented**. Adhesion formation or unwanted **scar** tissue accumulation/encapsulation complicates a variety of surgical procedures. As described above, surgical adhesions complicate virtually any open or endoscopic surgical. . . the function of the surgical implant (e.g., breast implant, artificial joint, surgical mesh, vascular graft, dural patch). Chronic inflammation and **scarring** also occurs during surgery to correct chronic sinusitis or removal of other regions of chronic inflammation (e.g., foreign bodies, infections. . .

DETD . . . "film", or "wrap" which releases the drug over a period of time such that the incidence of surgical adhesions is **reduced**. During endoscopic procedures, the paclitaxel-polymer preparation is applied as a "spray", via delivery ports in the endoscope, to the mesentery. . . to 20% paclitaxel is applied to the surface of the surgical implant (e.g., breast implant, artificial joint, vascular graft) to **prevent** encapsulation/inappropriate **scarring** in the vicinity of the implant. In yet another preferred embodiment, a polymeric implant containing 0.1% to 20% paclitaxel by. . . cavity, chest cavity, abdominal cavity, or at the operative site during neurosurgery) such that recurrence of inflammation, adhesion formation, or **scarring** is **reduced**. In another embodiment, lavage fluid containing 1 to 75 mg/m.sup.2 (preferably 10 to 50 mg/m.sup.2) paclitaxel, would be used at. . .

L36 ANSWER 47 OF 149 USPATFULL on STN

SUMM . . . harmless topical depigmenting substances with good efficacy. The use of such substances with good efficacy is most particularly desired for **treating** regional hyperpigmentations caused by melanocyte hyperactivity, such as idiopathic melasmas, occurring during pregnancy ("pregnancy mask" or chloasma) or during oestro-progestative. . . . post-lesional cicatrization, and also certain leukodermas, such as vitiligo. For these conditions (in which the cicatrizations can result in a **scar** which gives the skin a whiter appearance) and for leukodermas, failing the ability to repigment the damage to skin, the. . . .

DETD [0040] Isoflavonoids of natural origin are preferably used. Included are: daidzin, genistin, daidzein, formononetin, cuneatin, **genistein**, isoprunetin and prunetin, cajanin, orobol, pratensein, santal, junipegenin A, glycitein, afrormosin, retusin, tectorigenin, irisolidone, and jamaicin, and also analogues and. . . .

DETD [0041] Isoflavones are preferred for use in the present invention. This term covers both the aglycone forms (e.g., daidzein, **genistein** and glycitein) and the glycosylated forms (e.g., daidzine, genistine, glycitine) of the isoflavones.

CLM What is claimed is:

. . . composition according to claim 1, wherein said isoflavonoid is selected from the group consisting of daidzin, genistin, daidzein, formononetin, cuneatin, **genistein**, isoprunetin and prunetin, cajanin, orobol, pratensein, santal, junipegenin A, glycitein, afrormosin, retusin, tectorigenin, irisolidone, jamaicin, and mixtures thereof.

IT **446-72-0**, Genistein 480-23-9, Orobol 485-72-3, Formononetin 486-66-8, Daidzein 529-59-9, Genistin 529-60-2, Santal 548-77-6, Tectorigenin 550-79-8, Afrormosin 552-59-0, Prunetin 552-66-9, Daidzin 2284-31-3, Pratensein 2345-17-7, Irisolidone 4569-98-6, Isoprunetin 7159-95-7 7741-28-8, Cuneatin 21572-58-7 24211-36-7, Jamaicin 32884-36-9, Cajanin 37816-19-6, Retusin 40957-83-3, Glycitein 54734-40-6 76265-28-6, Junipegenin a 220717-78-2

L36 ANSWER 41 OF 149 USPATFULL on STN

SUMM [0012] U.S. Pat. No. 6,228,887 to Kligman discloses **treating** such skin disorders as photodamage, hyperpigmentation, rosacea, and **scarring** topically with high strength retinoids at a concentration effective to cause desquamation. Retinoids activate the the epidermal growth factor receptor,. . . skin cells, which results in the desquamation sought by this patent. The clinical examples given in this patent only involve **treating** photodamaged skin.

DETD [0018] The art has addressed inflammation and **scarring** caused by acne as a secondary benefit to the **treatment** of the disease; that is, if the acne is cured the factors causing **scarring** will be eliminated. There is otherwise no **treatment** directed at **preventing scarring** from acne. Neither is there presently any direct **treatment** for the inflammation accompanying acne. The conventional **treatment** acts to **prevent** further problems by alleviating the cause of the acne; for example, a patient is **treated** with tetracycline, an antiobiotic, in hopes of killing the P. acnes, and the death of the bacteria will effectively end the inflammation and future **scarring**. Much as antipyretics, analgesics, decongestants, and antihistamines have been developed to **treat** the symptoms of colds and upper respiratory infections (as opposed to antibiotics and antivirals to kill off the invading bacteria and viruses), there is a need for **treatments** diminishing if not **preventing scarring** and inflammation in acne.

DETD . . . areas of injury, invade acne-affected skin, and release both a collagenase (MMP-8) and another protease (neutrophil elastase) that likely exacerbate **scarring**. Additionally, we have discovered that acne-affected skin has an elevated collagenase (MMP-1) level from resident skin cells that further exacerbates **scarring**. We have disclosed that **inhibition** of these dermal matrix-degrading enzymes with the use of MMP **inhibitors** (in addition to and including retinoids) can **lessen scarring** of acne-affected skin. Neutrophils circulate in the blood and therfore must be recruited by a signalling mechanism to induce their. . .

DETD [0029] Indirect MMP inhibitors include the kinase inhibitors **genistein** and quercetin (as described in U.S. Pat. No. 5,637,703, U.S. Pat. No. 5,665,367, and FR-A-2,671,724, and related compounds, as well. . .

DETD . . . inhibits proliferation, and induces apoptosis of acute myelogenous leukemia cells", Blood, vol. 94, no. 8, Oct. 15, 1999 (pp. 2844-53). **Genistein**: Tabary et al., "**Genistein** inhibits constitutive and inducible NFkappaB activation and decreases IL-8 production by human cystic fibrosis bronchial gland cells", Am J. Pathol,. . . 12-epi-scalaradial, and LY311727; arachidonyl methyl ketone analogue (AACOCH.sub.3) and the eicosapentanoyl analogue (EPACHOHCF.sub.3) had no effect on TNF-induced NF-κB activation. **Genistein**, erbstatin: Natarajan et aL, "Protein tyrosine kinase inhibitors block tumor necrosis factor-induced activation of nuclear factor-KB, degradation of IKBα, nuclear. . .

DETD [0033] **Inhibitors** of TLRs (toll-like receptors) and/or other receptors that are sensitive to the LPS-like compounds associated with **acne lesions** can be used to ameliorate the signalling that induces the cytokines TNFα, IL-1β, IL- 8, and IL-10, as shown in. . .

AB A cell culture inside a three-dimensional gel of fibrillar collagen is an experimental model used to study the response of cells to the extracellular matrix. Many cell types induce the contraction of gel and simultaneously decrease their production of type I collagen, whereas the expression of interstitial collagenase (matrix metalloproteinase-1; MMP-1) is enhanced. me have previously shown that in osteogenic cells the collagen receptor alpha 2 beta 1 integrin is a positive regulator of MMP-1 and that the number of alpha 2 beta 1 integrins on the cell surface also regulates the magnitude of contraction. However, the downregulation of collagen mRNA levels is not initiated by alpha 2 beta 1 integrin. Here, we have studied in human KHOS-240 and MG-63 osteosarcoma cells and in human skin fibroblasts the effects of tyrosine kinase inhibitors on collagen gel contraction and on the regulation of MMP-1 and collagen alpha 1(I) genes by extracellular collagen. The induction of MMP-1 could be inhibited by all tyrosine kinase inhibitors tested with the exception of **genistein**. None of them could prevent the downregulation of collagen expression. Thus, the collagen-induced alterations in the expression of MMP-1 and collagen alpha 1(I) seem to be dependent on distinct signal transduction pathways. Many of the **inhibitors**, including **genistein**, could **prevent** the contraction of collagen gels. The effect was not related to their ability to **inhibit** cell growth, because an **inhibitor** specific for DNA synthesis and cell division did not have the same effect. Thus, we suggest that the process of collagen gel contraction requires protein-tyrosine phosphorylation and that the ability of cells to contract collagen gels is not related to the induction of MMP-1 or to the level of collagen alpha 1(I) expression. Finally, we propose that the tyrosine kinase **inhibitors** might be considered as candidate molecules in the **treatment** of pathological **scar** contraction. (C) 1996 Academic Press, Inc.

L36 ANSWER 58 OF 149 USPATFULL on STN

SUMM Anti-acne actives can be effective in **treating** acne vulgaris, a chronic disorder of the pilosebaceous follicles. The condition involves inflammation of the pilosebaceous apparatus thereby resulting in lesions, which may include papules, pustules, cysts, comedomes, and severe **scarring**. The bacteria Corynebacterium acnes and Staphylococcus epidermidis are usually present in the pustular contents.

SUMM Anti-wrinkle, anti-skin atrophy and skin repair actives can be effective in replenishing or rejuvenating the epidermal layer. These actives generally provide these desirable skin care benefits by promoting or maintaining the natural process of desquamation. Nonlimiting examples of antiwrinkle and anti-skin atrophy actives include retinoic acid and its derivatives (e.g., cis and trans); retinal; retinol; retinyl esters such as retinyl acetate, retinyl palmitate, and retinyl propionate; vitamin B.sub.3 compounds (such as niacinamide and nicotinic acid), salicylic acid and derivatives thereof (such as 5-octanoyl salicylic acid, heptyloxy 4 salicylic acid, and 4-methoxy salicylic acid); sulfur-containing D and L amino acids and their derivatives and salts, particularly the N-acetyl derivatives, a preferred example of which is N-acetyl-L-cysteine; thiols, e.g. ethane thiol; hydroxy acids, phytic acid, lipoic acid; lysophosphatidic acid; skin peel agents (e.g., phenol and the like); Actein 27-Deoxyactein Cimicifugoside (available from Cirnigoside); adapalene; ademethionine; adenosine; aletris extract; alkyl glutathione esters; alkoxyalkoxy alkoxyn benzoic and derivatives; aloe derived lectins; amino propane phosphoric acid; 3-aminopropyl dihydrogen phosphate; Amadorine (available from Barnet Products); anise extracts; AOSINE (available from Secma); arginine amino benzoate; ASC III (available from E. Merck, located in Darmstadt, Germany); ascorbic acid; ascorbyl palmitate; asiatic acid; asiaticosides; ARLAMOL GEO.TM. (available from ICI, located in Wilmington, Del.); azaleic acid; benzoic acid derivatives; bertholletia extracts; betulinic acid; BIOCHANIN A AND BIOPEPTIDE CL (available from Sederma, located in Brooklyn, N.Y.); BIOPEPTIDE EL (available from Sederma); biotin; blackberry bark extract; blackberry lily extracts; black cohosh extract; blue cohesh extract; butanoyl betulinic acid; carboxymethyl 1,3 beta glucan; catecholamnines; chalcones; citric acid esters; chaste tree extract; clover extracts; coumestrol; CPC Peptide (available from Barnet Products); daidzein; dang gui extract; darutoside; debromo laurinterol; 1-decanoyl-glycero-phosphonic acid; dehydrocholesterol; dehydrodicreosol; dehydrodieugenol; dehydroepiandersterone; DERMOLECTINE (available from Sederma); dehydroascorbic acid; dehydroepiandersterone sulfate; dianethole; dihydroxy benzoic acid; 2,4 dihydroxybenzoic acid; diglycol guanidine succinate; diosgenin; disodium ascorbyl phosphate; dodecanedioic acid; Ederline (available from Seporga); Enderline (available from Laboratories Seporga); equol; eriodictyol; estrogen and its derivatives; ETF (available from Laboratories Seporga); ethocyn; ELESERYL SH (available from Laboratories Serobiologiques, located in Somerville, N.J.); ENDONUCLEINE (available from Laboratories Serobiologiques); ergosterol; eythrobic acid; fennel extract; fenugreek seed extract; FIBRASTIL (available from Sederma); FIBROSTIMULINES S and P (available from Sederma); FIRMOGEN LS 8445 (available from Laboratories Serobiologiques); formononetin; forsythia fruit extract; gallic acid esters; gamma amino butyric acid; GATULINE RC (available from Gattlefosse, located in Priest, France); **genistein**; genisteine; genistic acid; gentisyl alcohol; gingko bilboa extracts; ginseng extracts; ginsenoside (RO, R.sub.6-1, R.sub.6-2, R.sub.6-3, R.sub.C, R.sub.D, R.sub.E, R.sub.F, R.sub.F-2, R.sub.G-1, R.sub.G-2); gluco pyranosyl-L-ascorbate; glutathione and its esters; glycitein; hesperitin; hexahydro curcumin; HMG- coenzyme A reductase inhibitors; hops extracts; 11 hydroxy undecanoic acid; 10 hydroxy decanoic acid; 25-hydroxycholesterol; 7-hydroxylated sterols; hydroxyethyl isostearyloxy isopropanolamine; hydroxy-tetra methyl piperidinyloxy;

hypotaurine; ibukijakou extract; isoflavone SG 10 (available from Barnet Products); kinetin; kohki extract; L-2-OXO-thiazolidine-4-carboxylic acid esters; lactate dehydrogenase inhibitors; 1-lauryl, -lyso-phosphatidyl choline; lectins; lichochalcone LF15 (available from Maruzen); licorice extracts; lignan; lumisterol; lupenes; luteolin; lysophosphitidic acid; magnesium ascorbyl phosphate; margin; melatonin; melibiose; metalloproteinase inhibitors; methoprene; methoprenic acid; mevalonic acid; MPC COMPLEX (available from CLR); N methyl serine; N methyl taurine; N, N.sup.1-bis (lactyl) cysteamine; naringenin; neotigogenin; o-desmethylangoiensin; oat beta glucan; oleanolic acid; pantethine; phenylalanine; photoanethone; piperdine; placental extracts; pratensein; pregnenolone; pregnenolone acetate; pregnenolone succinate; premarin; quillaic acid; raloxifene; REPAIR FACTOR 1 and REPAIR FACTOR FCP (both available from Sederna); retinoates (esters of C.sub.2-C.sub.20 alcohols); retinyl glucuronate; retinyl linoleate; S-carboxymethyl cysteine; SEANAMINE FP (available from Laboratories Serobiologiques); sodium ascorbyl phosphate; soya extracts; spleen extracts; tachysterol; taurine; tazarotene; tempol; thymulen; thymus extracts; thyroid hormones; tigogenin; tocopheryl retinoate; toxifolin; traumatic acid; tricholine citrate; trifoside; uracil derivatives; ursolic acid; vitamin D.sub.3 and its analogs; vitamin K; vitex extract; yam extract; yamogenin; zeatin; and mixtures thereof.

L36 ANSWER 68 OF 149 USPATFULL on STN

DETD . . . to inhibit apoptosis in cerebellar granule cells, although by distinct mechanisms (Galli et al., 1995). The protein tyrosine kinase inhibitors **genistein** and herbimycin A have both been shown to prevent anti-CD3 monoclonal antibody-induced thymic apoptosis (Migita et al., 1994). Interleukin-6 (IL-6). . .

DETD . . . or speeding up the overall regeneration process by administering regenerated tissue to the site of injury is beneficial as it **lessens** the chance that the body will attempt to repair the injury, leading to the formation of **scar** tissue and the loss of normal tissue structure and function.

PI US 5885829 19990323

LL on STN

DETD . . . inflammatory diseases including but not limited to rheumatoid arthritis, inflammatory bowel disease, multiple sclerosis, psoriasis and asthma; wound healing and **scar reduction**; and neurodegenerative diseases. Therefore, the development of cell-based assays that provide information on the effect of a test compound on. . .

DETD . . . of tumor growth and metastasis, angiogenesis, thrombosis, restenosis, vascular overgrowth during macular degeneration, foam cell formation, inflammatory diseases, wound healing, **scar reduction**, and neurodegenerative diseases.

DETD . . . 10 μM Calphostin C (a protein kinase C inhibitor), 10 μM KN-52 (a Calmodulin dependent protein kinase inhibitor), 10 μM **genistein** (a tyrosine kinase inhibitor) and 10 nM wortmannin (a phosphatidyl inositol kinase inhibitor. These agents were also applied during measurement. . . different from the profile for cell motility. Calphostin C, for example, was equally effective at inhibiting cell spreading and movement, **genistein** and KN-62 were ineffective at the concentrations used at blocking either cellular response, and Wortmannin was more effectve at blocking. . .

CLM What is claimed is:

. . . of tumor growth and metastasis, angiogenesis, thrombosis, restenosis, vascular overgrowth during macular degeneration, foam cell formation, inflammatory diseases, wound healing, **scar reduction** , and neurodegenerative diseases.

. . . of tumor growth and metastasis, angiogenesis, thrombosis, restenosis, vascular overgrowth during macular degeneration, foam cell formation, inflammatory diseases, wound healing, **scar reduction** , and neurodegenerative diseases.

. . . of tumor growth and metastasis, angiogenesis, thrombosis, restenosis, vascular overgrowth during macular degeneration, foam cell formation, inflammatory diseases, wound healing, **scar reduction** , and neurodegenerative diseases.

AB A cell culture inside a three-dimensional gel of fibrillar collagen is an experimental model used to study the response of cells to the extracellular matrix. Many cell types induce the contraction of gel and simultaneously decrease their production of type I collagen, whereas the expression of interstitial collagenase (matrix metalloproteinase-1; MMP-1) is enhanced. We have previously shown that in osteogenic cells the collagen receptor α2β1 integrin is a positive regulator of MMP-1 and that the number of α2β1 integrins on the cell surface also regulates the magnitude of contraction. However, the downregulation of collagen mRNA levels is not initiated by α2β1 integrin. Here, we have studied in human KHOS-240 and MG- 63 osteosarcoma cells and in human skin fibroblasts the effects of tyrosine kinase inhibitors on collagen gel contraction and on the regulation of MMP-1 and collagen α1(I) genes by extracellular collagen. The induction of MMP-1 could be inhibited by all tyrosine kinase inhibitors tested with the exception of **genistein**. None of them could prevent the downregulation of collagen expression. Thus, the collagen-induced alterations in the expression of MMP-1 and collagen α1(I) seem to be dependent on distinct signal transduction pathways. Many of the inhibitors, including **genistein**, could prevent the contraction of collagen gels. The effect was not related to their ability to inhibit cell growth, because an inhibitor specific for DNA synthesis and cell division did not have the same effect. Thus, we suggest that the process of collagen gel contraction requires protein-tyrosine phosphorylation and that the ability of cells to contract collagen gels is not related to the induction of MMP-1 or to the level of collagen α1(I) expression. Finally, we propose that the tyrosine kinase inhibitors might be considered as candidate molecules in the treatment of pathological **scar** contraction.

AB A pharmaceutical composition for treatment of liver cirrhosis, interstitial lung disease, chronic renal failure, **scars**, scleroderma, arteriosclerosis, and rheumatoid arthritis contains a substance which inhibits HSP47 production, selected from a malt extract, a flavonoid compound, a protein-bound polysaccharide from Coriolus versicolor, a paeoniflorin derivative, a tocopherol derivative, and a ferulic acid derivative HSP47 is apparently involved in processing of procollagen to collagen. The composition can efficiently improve the physiol. condition of a patient exhibiting overprodn. of the extracellular matrix, and is useful for preventing or treating various diseases accompanied with abnormal growth of the vascularization. Thus, HSP47 production by human uterus cancer cell line HeLa S3 was inhibited in vitro by paeoniflorin (100 mM), α-tocopherol (20 μM), and ferulic acid (100 μM).
